## Lesson 8.5 - Area of Circles

Circle Area Conjecture - The area of a circle is given by the formula $A=\pi r^{2}$ where A is the area and $r$ is the radius of the circle.

**When working with area, we must ALWAYS work from radius.
***In this lesson it will be important to distinguish between $\approx$ and $=$. Any time you are asked to calculate a value with an $=$, you will leave the answer in terms of $\pi$. Any time you asked to calculate a value with an $\approx$, you will calculate the value by multiplying $\pi$ out.

## Example 1: Find exact area of a circle given radius

If $r=9 \mathrm{~cm}, A=$ $\qquad$
$A=\pi r^{2}$
$A=\pi(9)^{2} \quad * *$ To square a number, you can either multiply it by itself or use the exponent button on your calculator.

$A=\pi(81)$
$\boldsymbol{A}=\mathbf{8 1} \boldsymbol{\pi} \mathbf{c m}^{2} \quad * *$ Because this problem gave us an "equal sign", we leave our answer in terms of $\pi$.

## Example 2: Find exact area of a circle given diameter

If $d=6.4 \mathrm{~cm}, A=$ $\qquad$
We are given diameter, but we need radius. Remember that radius is half of the diameter.
$r=\frac{6.4}{2}=3.2$
$A=\pi r^{2}$
$A=\pi(3.2)^{2}$
$A=\pi(10.24)$
$\boldsymbol{A}=\mathbf{1 0 . 2 4 \pi} \mathbf{c m}^{2} \quad * *$ Because this problem gave us an "equal sign", we leave our answer in terms of $\pi$.

Example 3: Find radius and diameter given exact area
If $A=529 \pi \mathrm{~cm}^{2}, r=$ $\qquad$ ,$d=$ $\qquad$
This problem will have two answers.
$A=\pi r^{2}$
$529 \pi=\pi r^{2} \quad * *$ Since there is a $\pi$ on both sides of the equation, we can divide it out.
$\frac{529 \pi}{\pi}=\frac{\pi r^{2}}{\pi}$
$529=r^{2}$
**To undo a square, we must square root.

|  | - |  |  |  |  | \% ${ }^{\text {a }}$ | 88\%45 |  |  |

| $r=23 \mathrm{~cm}$ | **R | mb | at | is | leng | so | pow | on | he units is 1. |
| $d=23 \cdot 2=46$ |  |  |  |  |  |  |  |  |  |
| $d=46 \mathrm{~cm}$ |  |  |  |  |  |  |  |  |  |

Example 4: Find exact area given circumference
If $C=36 \pi \mathrm{ft}, A=$ $\qquad$
$C=\pi d$
$36 \pi=\pi d$
$\frac{36 \pi}{\pi}=\frac{\pi d}{\pi}$
$36=d$
$r=\frac{36}{2}=18$
$A=\pi r^{2}$
$A=\pi(18)^{2}$
$A=\pi(324)$
$\boldsymbol{A}=\mathbf{3 2 4} \boldsymbol{\pi} \mathbf{f t}^{\mathbf{2}} \quad * *$ Because this problem gave us an "equal sign", we leave our answer in terms of $\pi$.

Example 5: Find exact circumference given area
If $A=196 \pi \mathrm{in}^{2}, C=$ $\qquad$
$A=\pi r^{2}$
$196 \pi=\pi r^{2}$
$\frac{196 \pi}{\pi}=\frac{\pi r^{2}}{\pi}$
$196=r^{2}$
$\sqrt{196}=\sqrt{r^{2}}$
$14=r$
$d=14 \cdot 2=28$
$C=\pi d$
$C=\pi(28)$
$\boldsymbol{C}=\mathbf{2 8} \boldsymbol{\pi}$ in $\quad * *$ Because this problem gave us an "equal sign", we leave our answer in terms of $\pi$.

## Example 6: Find approximate area given radius

If $r=7.8 \mathrm{~cm}, A \approx$ $\qquad$
$A=\pi r^{2}$
$A=\pi(7.8)^{2}$
$A=\pi(60.84)$
$A \approx 191.13 \mathbf{c m}^{2} \quad * *$ Because this problem gave us an "approximate sign", we multiply $\pi$ out (take $60.84 \cdot \pi$ ).

## Example 7: Find approximate area given diameter

If $d=3.12, A \approx$ $\qquad$
We are given diameter, but we need radius. Remember that radius is half of the diameter.
$r=\frac{3.12}{2}=1.56$
$A=\pi r^{2}$
$A=\pi(1.56)^{2}$
$A=\pi(2.4336)$
$A \approx 7.65$ units $^{2} \quad * *$ Because this problem gave us an "approximate sign", we multiply $\pi$ out.
** If the problem does not give you units (cm, in, ft , etc.), just write "units" as the unit of measure.

Example 8: Find radius and diameter given area
If $A=907.9 \mathrm{~m}^{2}, r \approx$ $\qquad$ ,$d \approx$ $\qquad$
This problem will have two answers.
$A=\pi r^{2}$
$907.9=\pi r^{2}$
$\frac{907.9}{\pi}=\frac{\pi r^{2}}{\pi}$
$288.99 \approx r^{2}$
**You will actually calculate $\frac{907.9}{\pi}$ and round (which is why this now becomes $\approx$.
$\sqrt{288.99} \approx \sqrt{r^{2}}$
$17 \approx r$
**You will have to round.
$r \approx 17 \mathrm{~m}$
$d \approx 17 \cdot 2=38$
$d \approx 38 \mathrm{~m}$

## Example 9: Find approximate area given circumference

If $C=7.85, A \approx$ $\qquad$
$C=\pi d$
$7.85=\pi d$
$\frac{7.85}{\pi}=\frac{\pi d}{\pi}$
$2.50 \approx d \quad * *$ You calculate $\frac{7.85}{\pi}$ and round (which is why this becomes $\approx$ ).
$r \approx \frac{2.50}{2} \approx 1.25$
$A=\pi r^{2}$
$A \approx \pi(1.25)^{2}$
$A \approx \pi(1.5625)$
$\boldsymbol{A}=4.91$ units $^{2} \quad * *$ Because this problem gave us an "approximate sign", we multiply $\pi$ out.
** If the problem does not give you units (cm, in, ft, etc.), just write "units" as the unit of measure.

Example 10: Find approximate circumference given area
If $A=136.46 \mathrm{in}^{2}, C \approx$ $\qquad$
$A=\pi r^{2}$
$136.46=\pi r^{2}$
$\frac{136.46}{\pi}=\frac{\pi r^{2}}{\pi}$
$43.44 \approx r^{2}$
**You calculate $\frac{136.46}{\pi}$ and round (which is why this becomes $\approx$ ).
$\sqrt{43.44} \approx \sqrt{r^{2}}$
$6.59 \approx r$
$d \approx 6.59 \cdot 2 \approx 13.18$
$C=\pi d$
$C \approx \pi(13.18)$
$\boldsymbol{C} \approx 41.41$ in $\quad * *$ Because this problem gave us an "approximate sign", we multiply $\pi$ out.
