## Lesson 2.3 Notes

1. Write the equation of the graph:

2. Write the equation of the graph:

In order to write the equation of a graph, we should write a table of points where the line crosses the grid. We know that this function is exponential, so we are looking for the constant ratio and the $f(0)$.

| $\boldsymbol{x}$ | $\boldsymbol{f}(\boldsymbol{x})$ |
| :--- | :--- |
| -1 | 10 |
| 0 | 5 |
| 1 | 2.5 |

After we write out the points, it is easy to see that the constant ratio is $\frac{1}{2}$ and the $f(0)=5$.

So, the explicit equation is $f(x)=\left(\frac{1}{2}\right)^{x} \cdot 5$
In order to write the equation of a graph, we should write a table of points where the line crosses the grid. We know that this function is exponential, so we are looking for the constant ratio and the $f(0)$.

| $\boldsymbol{x}$ | $\boldsymbol{f}(\boldsymbol{x})$ |
| :--- | :--- |
| 0 | 2 |
| 1 | 6 |
| 2 | 18 |

After we write out the points, it is easy to see that the constant ratio is 3 and the $f(0)=2$.

So, the explicit equation is $f(x)=3^{x} \cdot 2$
x

Let ${ }^{x}$ s write a table of points where the line crosses the grid.
3. Write the equation of the graph:

We know that this function is linear so we are looking for the constant difference and the $f(0)$.

| $\boldsymbol{x}$ | $\boldsymbol{f}(\boldsymbol{x})$ |
| :--- | :--- |
| 0 | 2 |
| 1 | -1 |

After we write out the points, it is easy to see that the constant ratio
is -3 and the $f(0)=2$.
So, the explicit equation is
$f(x)=-3 x+2$

Let's write a table of points
4. Write the equation of the graph: crosses the grid.

We know that this function is linear so we are looking for the constant difference and the $f(0)$.

| $\boldsymbol{x}$ | $\boldsymbol{f}(\boldsymbol{x})$ |
| :--- | :--- |
| $x_{1}$ | 3 |
| 0 | 4 |

After we write out the points, it is easy to see that the constant ratio is +1 and the $f(0)=4$.

So, the explicit equation is $f(x)=x+4$
5. Write the equation of the graph:

In order to write the equation of a graph, we should write a table of points where the line crosses the grid. We know that this function is exponential, so we are looking for the constant ratio and the $f(0)$.

| $\boldsymbol{x} \boldsymbol{x}$ | $\boldsymbol{f}(\boldsymbol{x})$ |
| :--- | :--- |
| -2 | 16 |
| -1 | 8 |
| 0 | 4 |

After we write out the points, it is easy to see that the constant ratio is $1 / 2$ and the $f(0)=4$.

So, the explicit equation is $f(x)=\left(\frac{1}{2}\right)^{x} \cdot 4$
6. Write the equation of the graph:

In order to write the equation of a graph, we should write a table of points where the line crosses the grid. We know that this function is exponential, so we are looking for the constant ratio and the $f(0)$.

| $\boldsymbol{x}$ | $\boldsymbol{f}(\boldsymbol{x})$ |
| :--- | :--- |
| 0 | 3 |
| 1 | 6 |
| 2 | 12 |

After we write out the points, it is easy to see that the constant ratio is 2 and the $f(0)=3$.

So, the explicit equation is $f(x)=2^{x} \cdot 3$

Let's write a table of points
7. Write the equation of theegraple: line crosses the grid. 8. Write the equation of the graph:

We know that this function is linear so we are looking for the constant difference and the $f(0)$.

| $\boldsymbol{x} \boldsymbol{x}$ | $\boldsymbol{f}(\boldsymbol{x})$ |
| :--- | :--- |
| 0 | -2 |
| 4 | 3 |

After we write out the points, it is

easy to find that the slope is $\frac{\Delta y}{\Delta x}=$
 function and never changes. The $y$-value is always equal to 1 .

So, the explicit equation is $f(x)=1$
$\frac{-5}{4}=-\frac{5}{4}$ and the $f(0)=-2$.
So, the explicit equation is
$f(x)=-\frac{5}{4} x-2$
